

Corona is a type of germ.

Germs live all around us, floating around the air.

Most of the time germs are ok.

But sometimes bad germs can get inside our bodies and make us feel poorly.

We can't see germs, but if you have a big microscope you can see that they look a bit like an octopus – a ball with lots of legs sticking out.

The legs are quite sticky like an octopus, this means they can stick to your hands.

The germs can not get through your skin but if they get inside your mouth, they can make you poorly.

If we wash our hands with soap the bad germs won't stick to us anymore and can't get into our mouth.

When you cough and sneeze you might let some bad germs out into the air or on your hands.

This is ok if you go and wash your hands.
